Copeland[™] Certified Compressors

Your customers deserve a better compressor. Your reputation demands it.

Certification makes the difference.

Emerson technology makes our compressors better.

What improvements do we make to every Copeland certified compressor?

- Higher oil standards
- Piston and rod material enhancement
- Molybdenum rings
- Motor protectors
- Sensor updates
- New-style heads
- New-design valves
- Asbestos-free gaskets

What does Copeland certified mean to you?

It means your peace of mind.

With Emerson's unparalleled expertise and testing, you'll get peace of mind knowing every Copeland certified compressor meets updated factory specifications for optimum reliability and performance – giving you everything you need to make your compressor installation a snap and your customer's system operation flawless.

It means your reputation.

Don't be fooled by ordinary rebuilt compressors. Whether it's a small mechanic shop or a bigger rebuilder business, if it's not a Copeland certified compressor, you never know what you'll get or how long it will work.

Every Copeland certified compressor operates as good as new. And we test and retest them to make sure this holds true. So you don't ever have to worry about a compressor causing a system failure, costly customer callbacks, installation hassles, safety issues or anything else. You can protect your reputation as you build your business with the certified power of Copeland certified compressors.

To attain the Copeland certified compressor status, over 500 parts are either replaced or recalibrated to Emerson's latest engineering standards.

Copeland compressors undergo numerous improvements every year. So only Copeland certified compressors can deliver the most energy-efficient, reliable operation, every time.

A process of reliability

When you need a replacement compressor, do you know exactly what you're getting? With Copeland certified compressors, you know every time: the certified reliability you need to keep your business profitable.

To achieve the Copeland certified compressor status, every compressor is put through a rigid process in which it is completely disassembled to the bare core, to ensure that you get a compressor remanufactured from the ground up. We test every essential component for operational integrity and replace all outdated and discontinued parts to meet Emerson's latest engineering and manufacturing guidelines. All in all, over 500 parts are either replaced or upgraded.

The end result is the most reliable remanufactured compressors in the world, from the most reliable remanufacturing process on the planet. And it's only from Emerson.

What parts do we upgrade and replace? Here are just a few:

- Demand Cooling
- Sentronic[™]-compatible oil pump
- Oil-suction screens
- Connecting rods
- Wrist pins
- Crankcase vent and oil-change valve parts
- Valves
- Bearings
- Gaskets
- Electrical terminals
- Insulators

- Any Loctite® bolt
- Every other part that doesn't meet our current engineering and production standards

Random tests of competitors' rebuilt compressors found that capacities ran as low as 56 percent of specification. This results in significantly reduced efficiency and performance, as well as increased costs to your customers. With Copeland certified compressors, you get 100 percent optimal capacity performance – guaranteed.

A process of reliability

When we say Copeland certified compressors perform as good as new, it's not just a claim. **It's a fact.**

By completely disassembling and meticulously testing every part of every remanufactured compressor, we know exactly how it will perform once it is back online. That's why we are so picky with every compressor that comes into our facility. And why we are so confident with every compressor that is produced.

We know exactly what to look for, how to change it and when to change it – because there are numerous improvements made every year, from updated specifications to enhanced parts.

For example, every Copeland certified compressor is now configured to handle the refrigerants of tomorrow, as well as the current refrigerants of today. Which means you will get a level of compressor performance and energy efficiency that is more than just good. It is as good as new.

From K compressors to 6R models, only Copeland certified compressors can meet all your unique application needs.

Certified safety, certified protection

From installation to operation, the safety of your technicians and your customers is paramount – which is why all Copeland certified compressors are UL recognized. UL recognition means our remanufactured compressors have been tested by an unbiased third party to a rigid set of international standards. Standards that reduce any foreseeable risk of fire, electrical shock or other possible safety hazards, keeping your customers protected from potential mishaps and protecting your reputation from potential catastrophes.

In addition, Emerson guarantees that the compressors you deliver to your customers will deliver the capacities they expect. And with the ability to handle the demanding systems of tomorrow, you'll have the time-tested power of Copeland certified compressors working hard to keep their systems safe and efficient, today.

All Copeland certified compressors are UL recognized – a third-party guarantee that ensures every one of our compressors has been put through a rigid set of international testing standards that have been found to reduce any fire or electrical safety hazards.

Once you compare, you'll see there's no comparison.

Procedure Copeland certified compressors Independent rebuilders' compressors			<u> </u>
1. Super K/Discus® compressors get new suction-reed valving, stainless steel reeds and positive-displacement of jumps 2. Certain Discus models receive Delta Reed modifications to ensure extended life for demanding applications 100% disassembly, with the complete removal of all main bearings and internal valving 4. All cylinder walls are air gauged to match Copeland specifications, and the crankcase is upgraded to current Emerson standards 4. Cleaned and/or reground to perfectly match Emerson specifications. 4. Pistons 5. New aluminum pistons and rods 6. Crankshaft 6. Completely cleaned, gauged, upgraded and polished to current Emerson specifications 6. Oil pump 7. Oil pumps are 100% disassembled, cleaned, gauged and retested to Emerson specifications; otherwise, they are replaced 6. Stators and rotor 6. Sourced components 6. All parts meet Emerson's latest engineering standards 7. None of the	Procedure	Copeland certified compressors	Independent rebuilders' compressors

A legacy of solutions – only from Emerson

The most advanced compressors need the most advanced training. Which is why Emerson offers contractors the best training in the industry. Courses include Compressor Operation and Service Seminars (COSS), supermarket seminars and much more. We also provide extensive computer education programs to help you stay up to date with emerging technologies.

For over 80 years, Emerson has been pioneering more effective, energy-efficient refrigeration solutions. And with Copeland certified compressors, we deliver a higher caliber of quality – from rock-solid reliability and unrivaled performance to superior safety – that is simply the best...and as good as new.

To get your hands on the best refrigeration products – the products you trust and that your reputation deserves – call your Emerson Authorized Full-Line Wholesaler. There you'll find Copeland certified compressors, along with all the training and support you need to grow your business.

To locate the Emerson Authorized Full-Line Wholesaler closest to you, visit Climate.Emerson.com/distributor-locator
