

Before you blow fuses, blow time, blow money, or blow yourself up...

Look for this mark.

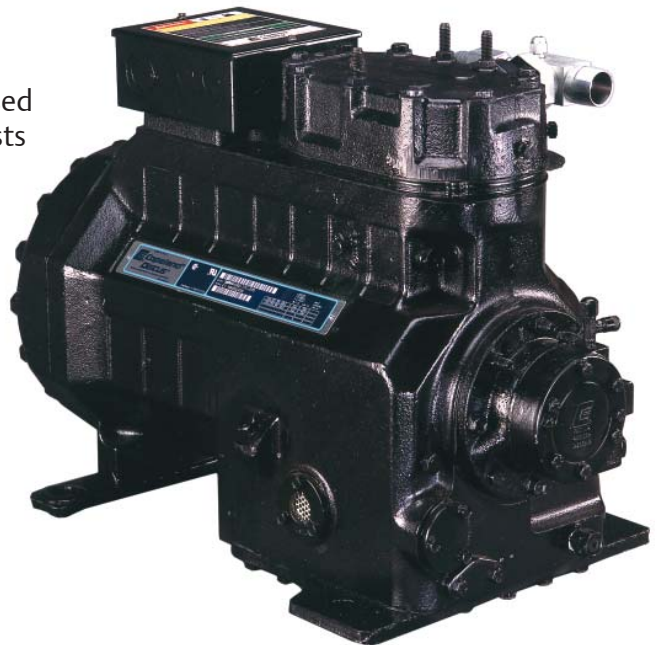

Underwriters Laboratories® created the  symbol for components – like Certified Copeland® remanufactured compressors – that meet the same exacting UL safety standards as the original component. They have surpassed over 30 UL construction and electrical standards and tests designed to guard against electrical fire and explosion.

All Certified Copeland remanufactured compressors have earned the privilege of bearing the  mark. Few others can make that claim.

Don't risk installing a non- certified replacement compressor. Not only could you be facing a product failure or worse, you could be invalidating the original UL listing for the entire refrigeration or air conditioning system, and you could be violating local or state electrical codes.

So don't blow it. Always look for the  symbol on the nameplate, the mark of UL recognized safety.
